

● GABION

A rectangular stone net is made of wire mesh sheets electrically welded with post coating steel wires to form a hexagonal. Pebbles or stones fill its inside to make a wall structure facility

A rectangular stone net is highly resistant against corrosions and highly durable. It is semi permanent and it is a convenient structure that does not require additional management after installation. Compared to other structures, it is less affected by the environment, You can reduce the construction period and perform continuous works

RECTANGULAR MESH GABION

This product supplements the weakness of general hexagon gabion. Each intersection is specially welded. After installation, no swelling is caused by the weight or deformation is caused by soil pressure.

RECTANGULAR MATTRESS GABION

It is installed on the riverside or lakeside in order to prevent excavation or soil losses or increased fluid speed caused by flooding or typhoon. Pebbles or crushed stones are used to enhance the exterior. After installation, grass and plants can grow between them. It is highly environment friendly and durable.

STONE NET

It is used for various lake environments. It is made of twisted threads that is low cost and easily installed. It is generally used for soil protection at the lakes in Korea.
